

Complete your Domino application transformation

Domino applications are valuable tools, but they need additional attention during a Domino-to-Microsoft transformation. With the right planning, assessment and migration practices, you can reduce costs by making sure all applications are handled correctly – without wasting resources on unused or outdated applications. We will work with you to understand your business, your applications, and your plans to develop the path best for your organization, saving you time and money. And, you can use Binary Tree’s Domino on Azure managed service to move your Domino server to Azure as you progress through your migration.

Domino Application Services creates a clear and realistic approach for legacy application transformation in a multi-faceted solution.
